

# Food Computer

*Sponsored by OpenAg and the MIT Media Lab, the Science & Technology division is participating in a demonstration project to help develop hardware and software plans that will enable individuals to create their own Food Computer.*

**“Food Computer”** refers to a controlled environment agriculture devices developed by the OpenAg community that allows users to experiment, innovate, hack, and grow.

Every time users grow and harvest, they will contribute to a library of “Climate Recipes” that can be shared and scaled so that other users around the world can gain access to the best and freshest foods.
